Between Intention and Action: An Experiment on Individual Savings

MARGARET McCONNELL*

April 2012

ARSTRACY. This study provides experimental evidence about the barriers to adoption of formal sarsings in Africa, In collaboration with a large commercial bank, I conduct an experiment designed to measure the relative importance of consenience and information on the adoption of formal savings. When individuals can open an account at their place of business they are much more likely to open an account. Novel information about the benefits of savings has a slight but insignificant negative effect on account opening. While over half (55%) of individuals report an interest in opening an account when initially approached, only 2% of individuals are using the accounts 2 months later. I explore several potential explanations between individuals' self-seports of interest in the accounts and their later behavior. I argue that individuals' behavior in the experiment is consistent with social pressure to condorm to the encouragement to open an account and some projection bias in predicting their future behavior. The results illustrate that for individuals struggling to save, encouraging curedinent in formal finance may be loss effective than tools which help individuals office-chrough with self-reported savings intentions.

PRELIMINARY AND INCOMPLETE: PLEASE DO NOT CITE

JEL classification: D9 (Intertemporal Consumer Choice; Lifecycle Models and Saving), E21 (Consumption; Saving)

Keywords: Intertemporal Consumer Choice, Savings, Beliefs

I I am graded to the Bill and Melhads Gates Foundation for their generous support. I would like to thain Padous
Plancia, Raphael Bundien, Jowica Kimool and Kelly Belwell for declarated field work. I would like to thain Padous
Plancia Biyan, Julian Jantion, Amster Cohen, Erik Smortleng, Glisther Pail, Sera Limsch, Robins Dom Kerlen,
Glaccal Biyan, Julian Jantion, Amster Cohen, Erik Smortleng, Glisther Pail, Sera Limsch, Belwin Pande, Sup-basic
Wang, Margaret MacMillion and Time Cusmingham for extremely belyful comments. I would like to thai Limsch Bills
for their onlikewisties. The views expressed herein are those of the authors and do not necessarily reflect those of the
Bill and Meluda Gates Floundation.

Between Intention and Action: An Experiment on Individual Savings

This study provides experimental evidence about the barriers to adoption of formal savings in Africa. In collaboration with a large commercial bank, I conduct an experiment designed to measure the relative importance of convenience and information on the adoption of formal savings. When individuals can open an account at their place of business they are much more likely to open an account. Novel information about the benefits of savings has a slight but insignificant negative effect on account opening. While over half (55%) of individuals report an interest in opening an account when initially approached, only 2% of individuals are using the accounts 2 months later. I explore several potential explanations between individuals' selfreports of interest in the accounts and their later behavior. I argue that individuals' behavior in the experiment is consistent with social pressure to conform to the encouragement to open an account and some projection bias in predicting their future

behavior. The results illustrate that for individuals struggling to save, encouraging enrollment in formal finance may be less effective than tools which help individuals follow-through with self-reported savings intentions.
